

<b>TRUE</b>	The three basic rules of hierarchical structures are Scale, Interaction, and Architecture.
<b>TRUE</b>	Unmodified or “neat” polystyrene is a very “brittle” material.
<b>FALSE</b>	The glass transition temperature ( $T_g$ ) of an amorphous polymer is independent of the molecular weight of the polymer.
<b>TRUE</b>	Polystyrene foam products can be produced by two methods, extruded and expanded.
<b>TRUE</b>	A free radical initiator for polymerization requires an unpaired electron in an atomic orbital.
<b>FALSE</b>	The ratio of the secant modulus to the tangent modulus (i.e., secant modulus/tangent modulus) is always greater than one ( $>1.00$ ).
<b>TRUE</b>	The product of the “Reactivity Ratios” between two monomers in a free radical polymerization determines the monomer sequence in the resulting polymer chain.
<b>TRUE</b>	A craze in an amorphous polymer is associated with thin fibrils bridging the two separate polymer surfaces.
<b>FALSE</b>	The Izod and Charpy impact strength of a polymeric material is independent of the notch tip radius and the impact specimen thickness.
<b>TRUE</b>	“Mass” polymerized ABS (mABS) usually has a larger rubber particle domain size than “emulsion” polymerized ABS (eABS).
<b>TRUE</b>	The density of the crystalline region of polyethylene is about $1.00 \text{ g/cm}^3$ , and the density of the amorphous region of polyethylene is about $0.850 \text{ g/cm}^3$ to $0.855 \text{ g/cm}^3$ .
<b>FALSE</b>	The melt transition temperature ( $T_m$ ) of polyethylene is independent of the density of polyethylene.
<b>TRUE</b>	A <u>plastomer</u> is a polymer material which combines qualities of elastomers and plastics, such as rubber-like properties with the processing ability of plastic.
<b>FALSE</b>	The viscosity average molecular weight ( $M_v$ ) of a polymer molecular weight distribution is always lower than both the number average molecular weight ( $M_n$ ) and the weight average molecular weight ( $M_w$ ).
<b>FALSE</b>	The propagation rate of a crack through polyethylene material as measured by the PENT test is independent of the molecular weight distribution of the polyethylene material.
